

I was deliberating whether to continue these coronavirus musings at the end of last year, and considered that most people seem to be aware of what is going on, much information has been shared, I'm not sure what can be shared that is new – especially spiritually, and few people have interacted with me about the musings. So when the new year rolled around, I just let it go.

But then this one came to my attention. And I thought it worth sharing. Because for quite some time I didn't believe we would go back to normal. Why? Well, the nature of viruses is to mutate. And normal is what helped cause this virus – not the virus in itself, but our lack of preparedness as well as widespread knowledge about how to respond.

So this article contains both good news and bad news. This affects us long term in many ways.

Another article you may want to look up is the CTV one titled: **Socializing after the vaccine: Experts say shot won't offer 'free pass' right away.** It's put together by Melissa Couto Zuber, The Canadian Press Staff and was published Thursday, January 14, 2021 8:10AM EST

5 reasons to wear a mask even after you're vaccinated

Health Jan 15, 2021 12:57 PM EST PBS News Hour

As an emergency physician, Dr. Eugenia South was in the first group of people to receive a COVID vaccine. She received her second dose last week — even before President-elect Joe Biden.

Yet South said she's in no rush to throw away her face mask. "I honestly don't think I'll ever go without a mask at work again," said South, faculty director of the Urban Health Lab at the University of Pennsylvania in Philadelphia. "I don't think I'll ever feel safe doing that."

And although COVID vaccines are highly effective, South plans to continue wearing her mask outside the hospital as well.

Health experts say there are good reasons to follow her example.

"Masks and social distancing will need to continue into the foreseeable future — until we have some level of herd immunity," said Dr. Preeti Malani, chief health officer at the University of Michigan. "Masks and distancing are here to stay."

Malani and other health experts explained five reasons Americans should hold on to their masks:

1. No vaccine is 100% effective.

Large clinical trials found that two doses of the **Moderna** and **Pfizer-BioNTech** vaccines prevented 95% of illnesses caused by the coronavirus. While those results are impressive, 1 in 20 people are left unprotected, said Dr. Tom Frieden, a former director of the Centers for Disease Control and Prevention.

Malani notes that vaccines were tested in controlled clinical trials at top medical centers, under optimal conditions.

In the real world, vaccines are usually slightly less effective. Scientists use specific terms to describe the phenomenon. They refer to the protection offered by vaccines in clinical trials as “**efficacy**,” while the actual immunity seen in a vaccinated population is “effectiveness.”

The effectiveness of COVID vaccines could be affected by the way they’re handled, Malani said. The genetic material used in mRNA vaccines — made with messenger RNA from the coronavirus — is so fragile that it has to be carefully stored and transported.

Any variation from the CDC’s **strict guidance** could influence how well vaccines work, Malani said.

2. Vaccines don’t provide immediate protection.

No vaccine is effective right away, Malani said. It takes about two weeks for the immune system to make the antibodies that block viral infections.

COVID vaccines will take a little longer than other inoculations, such as the flu shot, because both the Moderna and Pfizer products require two doses. The Pfizer shots are given three weeks apart; the Moderna shots, four weeks apart.

In other words, full protection won’t arrive until five or six weeks after the first shot. So, a person vaccinated on New Year’s Day won’t be fully protected until Valentine’s Day.

3. COVID vaccines may not prevent you from spreading the virus.

Vaccines can provide two levels of protection. The measles vaccine prevents viruses from causing infection, so vaccinated people don’t spread the infection or develop symptoms.

Most other vaccines — including flu shots — prevent people from becoming sick but not from becoming infected or passing the virus to others, said Dr. Paul Offit, who advises the **National Institutes of Health** and **Food and Drug Administration** on COVID vaccines.

While COVID vaccines clearly prevent illness, researchers need more time to figure out whether they prevent transmission, too, said Phoenix-based epidemiologist Saskia Popescu, an assistant professor in the biodefense program at George Mason University’s Schar School of Policy and Government.

“We don’t yet know if the vaccine protects against infection, or only against illness,” said Frieden, now CEO of Resolve to Save Lives, a global public health initiative. “In other words, a vaccinated person might still be able to spread the virus, even if they don’t feel sick.”

Until researchers can answer that question, Frieden said, wearing masks is the safest way for vaccinated people to protect those around them.

4. Masks protect people with compromised immune systems.

People with cancer are at particular risk from COVID. Studies show they're more likely than others to become **infected and die** from the virus, but may not be protected by vaccines, said Dr. Gary Lyman, a professor at Fred Hutchinson Cancer Research Center.

Cancer patients are vulnerable in multiple ways. People with lung cancer are less able to fight off pneumonia, while those undergoing chemotherapy or radiation treatment have **weakened immune systems**. Leukemia and lymphoma attack immune cells directly, which makes it harder for patients to fight off the virus.

Doctors don't know much about how people with cancer will respond to vaccines, because they were excluded from randomized trials, Lyman said. Only a handful of study participants were diagnosed with cancer after enrolling. Among those people, **COVID vaccines protected only 76%**.

Although the vaccines appear safe, "prior studies with other vaccines raise concerns that immunosuppressed patients, including cancer patients, may not mount as great an immune response as healthy patients," Lyman said. "For now, we should assume that patients with cancer may not experience the 95% efficacy."

Some people aren't able to be vaccinated.

While most people with allergies can receive COVID vaccines safely, the CDC advises those who have had **severe allergic reactions to vaccine ingredients**, including polyethylene glycol, to avoid vaccination. The agency also warns people who have had dangerous allergic reactions to a first vaccine dose to skip the second.

Lyman encourages people to continue wearing masks to protect those with cancer and others who won't be fully protected.

5. Masks protect against any strain of the coronavirus, in spite of genetic mutations.

Global health leaders are extremely concerned about **new genetic variants of the coronavirus**, which appear to be at least **50% more contagious** than the original.

So far, **studies** suggest vaccines will still work against these new strains.

One thing is clear: Public health measures — such as avoiding crowds, physical distancing and masks — reduce the risk of contracting all strains of the coronavirus, as well as other respiratory diseases, Frieden said. For example, the **number of flu cases worldwide** has been dramatically lower since countries began asking citizens to stay home and wear masks.

"Masks will remain effective," Malani said. "But careful and consistent use will be essential."

The best hope for ending the pandemic isn't to choose between masks, physical distancing and vaccines, Offit said, but to combine them. "The three approaches work best as a team," he said.
